

Data Entry

ConditWatch® aims towards a routine acquisition of data regarding:

- Body weight
- Bioimpedance
- Body type

in pig fattening.

Data acquisition is carried out

- for the individual animal, triggered by RFID
- at each water or fodder intake
- accompanying the pig fattening
- with very good acceptance by the animals
- without forcing and
- without input of manpower.

Based on the daily calculations of the body-fat-ratio of the single animal, recommendations for its slaughter date are given.

ConditWatch® has been jointly developed by AGRAR Handelspartner Woldegk GmbH, CONVIA GmbH and the Institute of Agricultural and Urban Ecological Projects, affiliated to Humboldt University Berlin (IASP).

Condition Monitoring of Fattening Pigs

Key to Optimal Date of Slaughter

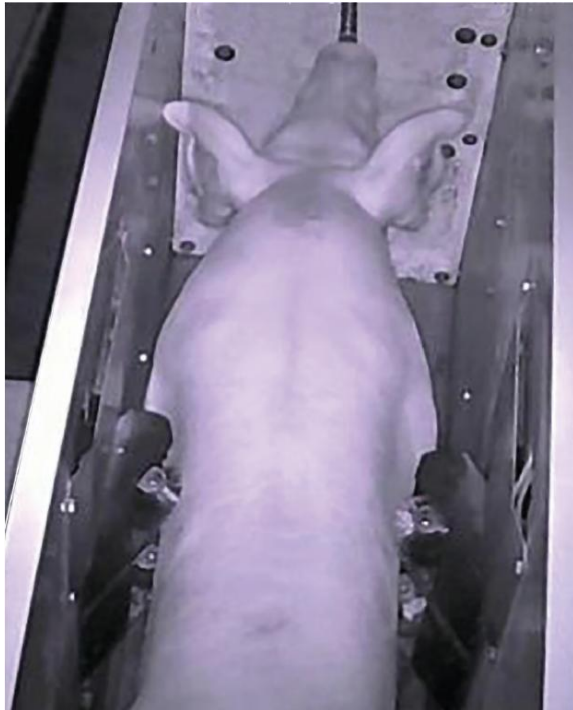

Awarded with Silver medal

by the Expert Commission of the German Agricultural Society DLG (Deutsche Landwirtschafts-Gesellschaft)

Application

Due to its mobility, stand-by function and the easily manageable design of the product, **ConditWatch®** can be used flexibly in different areas of the piggery, corresponding to your demands.

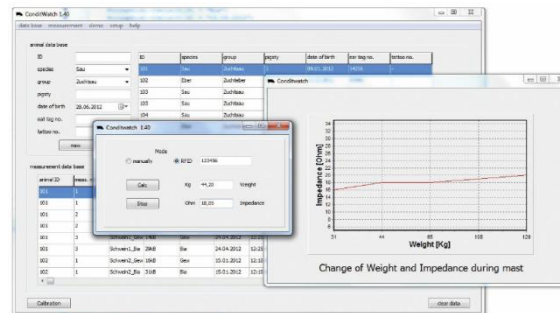

Goal

ConditWatch® supports you efficiently during the assessment of the grade of pig fattening.

ConditWatch® an innovative and practice-orientated product, monitoring the fattening process and calculating the fat-muscle-ratio in fattening pigs. It is used as an early determination of the optimal date of slaughter of the animals and reliably helps the avoidance of the tendency of over-fattening.

In order to efficiently counteract the fatty degeneration of pigs, the fattening requires great attention, especially with hormonal castrated boars.

Offer

ConditWatch® is sold by the AGRAR Handelspartner Woldegk GmbH. The initial installation in your business is carried out by the supplier. This service includes training in how to professionally use, clean and maintain the product.

The following additional services can be negotiated with the supplier:

- Specifications for an optimal adaptation to structural conditions in the business
- Conversion of the drinking gadget into an automatic feeder
- Colour marking of animals ready for slaughtering
- Sorting gates for housing systems with large groups
